

Language-based Geoguessr tool and trainer

[Geoguessr](#) is a geography game where you guess where you are in the world based on street view imagery. My tool will repeat part of the process players use: using language clues.

Given a string of text (pulled from street view imagery and extracted via Google lens or equivalent by the user) as input, output the top 5 most likely regions or countries where you might find that text.

[[For example:

From that we can pull:
 NORVÉG ÖNTÖTTVAS KÁLYHÁK

And the tool should be able to take that as input, notice the diacritic on the o, the [double acute accent](#), match it up with a line in the database showing how Hungarian is the only language that uses this.

The output should be something like:

Likely locations:

1. Hungary (90%)
2. Romania (3%)
3. Slovakia (2%)
4. Austria (1%)
5. Ukraine (1%)

If the text sample included that diacritic and German language, then the likelihood of Austria should increase. Etc.]]

German example:

“Straße gesperrt”

Should return:

Likely countries:

1. Germany (ß used in Germany/Austria)
2. Austria (ß used in Germany/Austria)
3. Switzerland (expect to see “Strasse” instead)
4. Liechtenstein (expect to see “Strasse” instead)

The database this tool links to will include many features that are already in existence on sites such as Plonk It. Some other feature examples: scripts (Sri Lankan vs Thai, etc.), street signs (especially stop signs), the presence of multiple languages (French + English signage pointing to New Brunswick, for example).

Other use cases, as time allows:

- A quiz feature which shows an image of a sign/billboard and you guess the country it comes from
- Adding the exact coordinates of the street view location and calculating correlations between these and feature embeddings
